Enaam Mohamed Elsayed Abouzed

The objective of this research was to study and evaluate the awareness and practices of Saudi Arabia family to towards taking care of clothes. The study was conducted on a sample of (56), Saudi house wives who lived in Ahsa, Saudi Arabia. The data was collected using questionnaires through personal interviews . percentage, variance an analysis, Pearson correlation coefficient, Geometric mean were used for data analysis..

The results of the study were:

- 1- There were significant differences between the level of knowledge toward care clothes and the variables of age, residential area, education, income, work, and number and kind of children.
- 2- There was strong correlation between income and knowledge related to the care of the respondents, while there was a weak correlation between knowledge of the respondents towards care of clothes according to the variables of age, residential area, education, income, employment, and the presence of children and their kind.
- 3- There were significant differences between respondents' awareness and practices towards the care of clothes according to the variables of age, residential area, education, income, work and number of children and their kind.
